Experiment - 09

Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

22nd September 2026

Syed Faiyaz Ahamed
241401113 B.Tech CSBS

AIM

To explore the built-in analytics, dashboard charts and report display options of the Hotel Booking application in Zoho Creator, and to check the availability of AI-assisted (Zia) features in the application and its editor.

OBJECTIVES

- To observe the KPI cards, charts and reports of the application dashboard.
- To study the charts of the dashboard, namely the donut charts for room type and meal plan and the line chart of total records.
- To identify the display formats available for a report.
- To understand the AI-assisted (Zia) capabilities of Zoho Creator and check the Design and Workflow areas for them.

SOFTWARE / TOOLS REQUIRED

- Zoho Creator (web-based low-code application development platform)
- Hotel Booking application created in Zoho Creator
- Web browser with an active internet connection
- Zoho account with access to the application and its editor

INTRODUCTION

AI-Assisted Features in Zoho Creator

AI-assisted features help users build applications and understand their data with less manual effort. In Zoho Creator, these features are provided under the Zia brand and include the following:

- **AI fields:** form fields that use Zoho's AI to perform sentiment analysis, keyword extraction, prediction, optical character recognition (OCR) and object detection on the data of a form.
- **AI tasks in Deluge:** script tasks that call AI models, for example to analyse the sentiment of text, extract keywords or recognise text in an image.
- **Zia assistance:** generative features such as the Zia App Builder, which creates applications from a description, and help with writing Deluge scripts.

The availability of these features depends on the Zoho Creator edition, the plan of the account and the interface version in use. Figure 1 relates them to the Hotel Booking application.

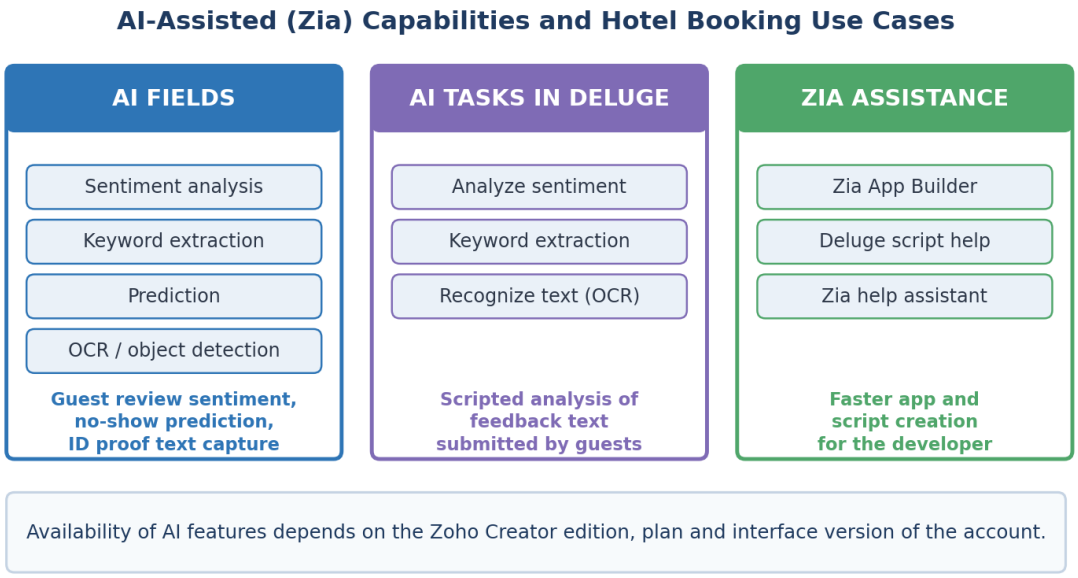

Figure 1: AI-Assisted (Zia) Capabilities and Hotel Booking Use Cases (Conceptual Diagram)

Zia

Zia is the artificial-intelligence assistant of the Zoho ecosystem. It provides capabilities such as data insights, prediction and assistance in working with application data across Zoho products. Whether and where Zia options appear in Zoho Creator depends on the account and plan.

Built-in Analytics and Dashboards

Zoho Creator provides built-in analytics through pages and dashboards that present application data visually without external tools. A dashboard combines several components on one page so that the state of the application can be understood at a glance. Figure 2 shows a typical layout for the Hotel Booking application, and the main components are listed in Table 1.

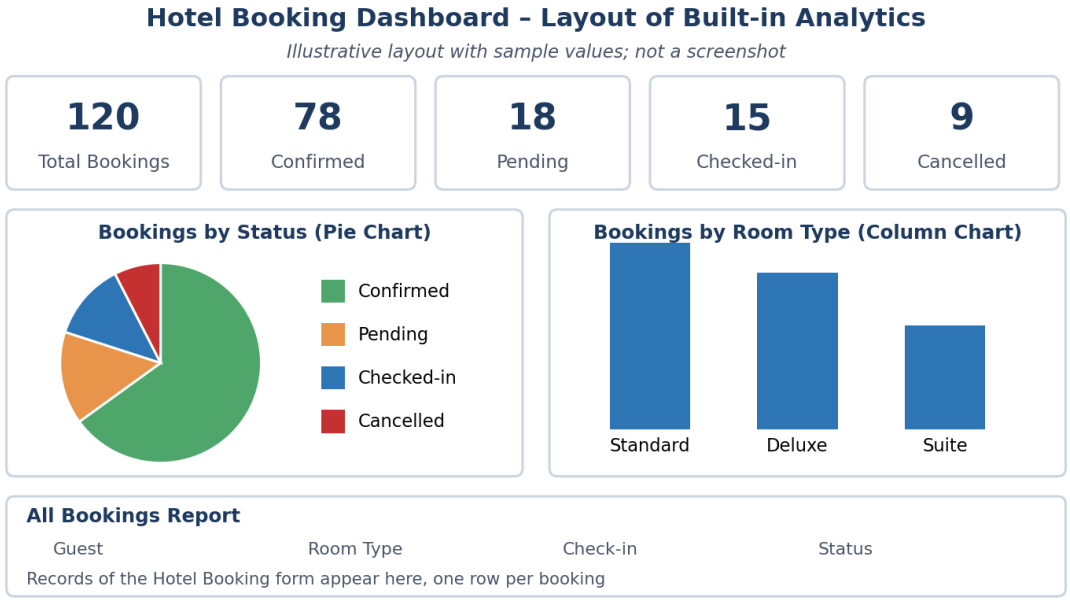

Figure 2: Layout of a Hotel Booking Dashboard (Illustrative, with Sample Values)

Component	Purpose in the Hotel Booking Application
KPI cards	Show a single key figure, such as total bookings or the total number of guests
Donut chart	Shows the share of bookings in each room type or meal plan, for example Standard 3, Deluxe 4, Suite 2 and Executive 2
Line chart	Shows how the total number of records changes over a range of dates
Reports	List the records of the Hotel Booking form with a column for each field
Interactive visualizations	Respond to the pointer; hovering over a segment shows its exact value

Table 1: Dashboard Components

Figure 3 shows how data moves from the forms to the decisions that management makes from the dashboard, with the optional AI layer.

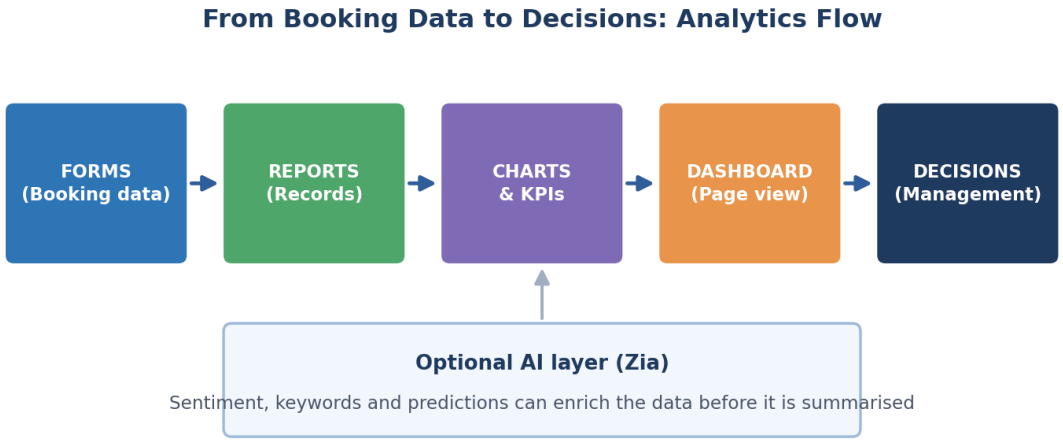

Figure 3: Analytics Flow from Booking Data to Decisions (Conceptual Diagram)

Report Display Formats

A report can be shown in more than one format through the Show As option, so that users can choose the one that suits the task. The formats are summarised in Figure 4.

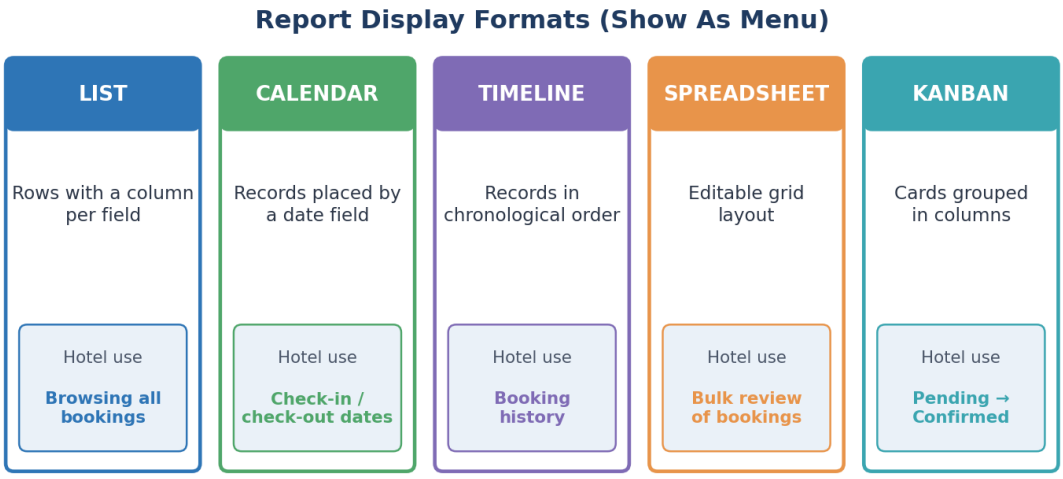

Figure 4: Report Display Formats and Their Use in the Hotel Booking Application

PROCEDURE

1. Open Zoho Creator and sign in. The home page lists the available applications.
2. Open the Hotel Booking application and select Access this application to open its live view.
3. Observe the dashboard (Home page), which contains the KPI cards, the charts and the report of bookings.

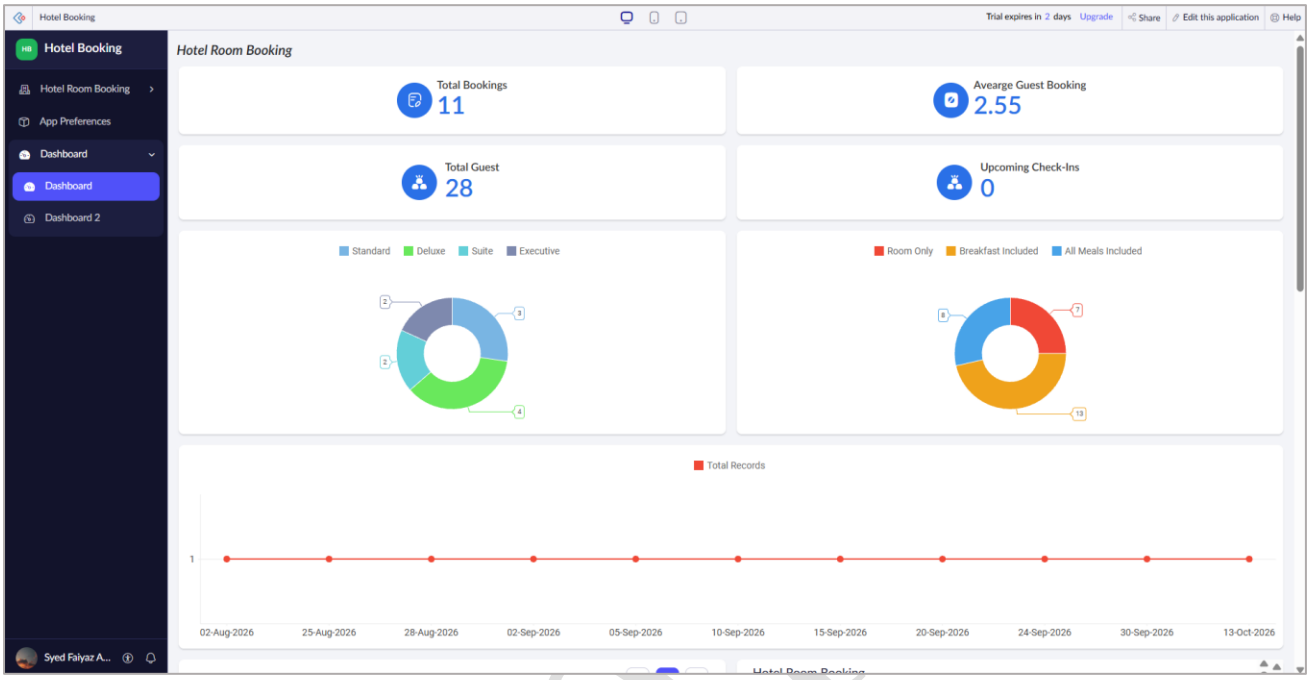

Figure 5: Hotel Booking Dashboard with Built-in Analytics

4. Examine the KPI cards and note the values displayed: Total Bookings 11, Average Guest Booking 2.55, Total Guest 28 and Upcoming Check-Ins 0.
5. Examine the donut chart of bookings by room type (Standard 3, Deluxe 4, Suite 2, Executive 2) and place the pointer over a segment. A tooltip shows the room type and the number of bookings.

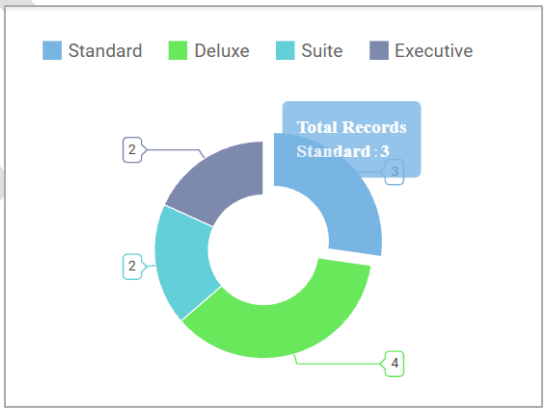

Figure 6: Donut Chart Showing Bookings by Room Type

6. Examine the donut chart of meal plans (Room Only 7, Breakfast Included 13, All Meals Included 8) and place the pointer over a segment. A tooltip shows the meal plan and its count.

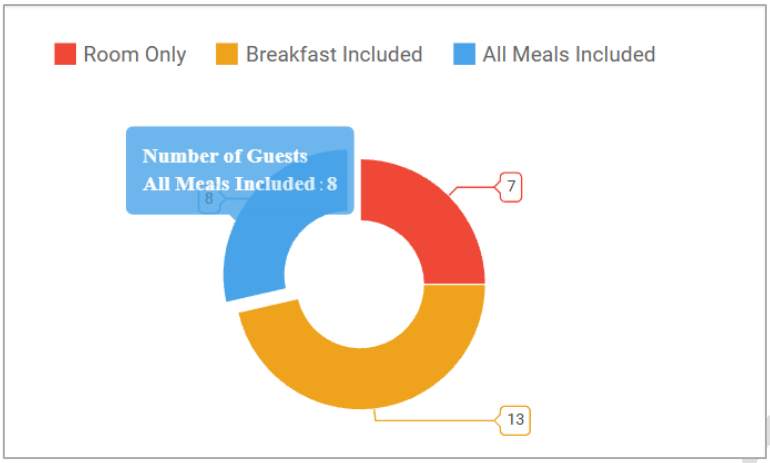

Figure 7: Donut Chart Showing Meal Plan

7. Open the options menu (three dots) of the bookings report and select Show As. Note the formats offered. The menu is only viewed; no report view is changed or saved.

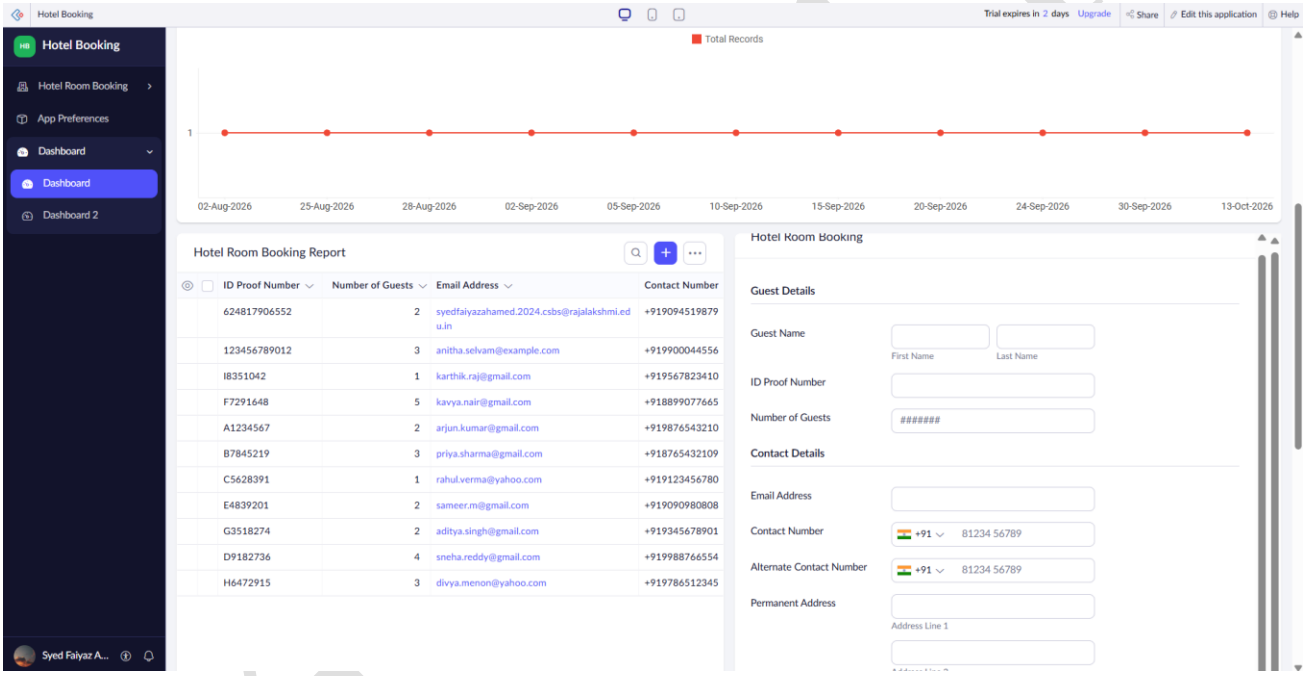

Figure 8: Report Display Formats in the Bookings Report

8. Select Edit this application to open the application editor and check the Design area, including the form field options, for any Zia or AI-specific option.

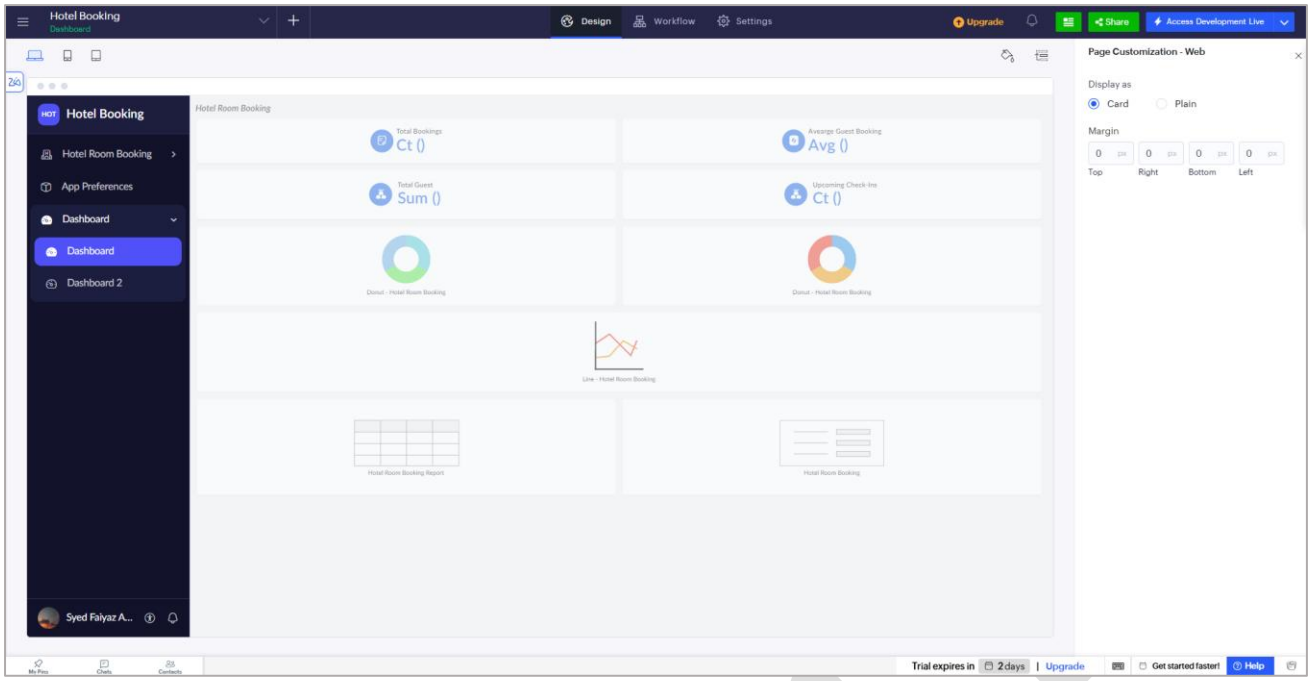

Figure 9: Zoho Creator Application Editor – Design Area

9. Check the Workflow section, including the Deluge script editor, for any AI-related tasks or assistance.
10. Note the account status and record whether Zia / AI-assisted functionality is available.

Dashboard Analytics

The KPI cards summarise key figures of the Hotel Booking application. Each card is calculated from the records of the booking form, as shown below. The values are those displayed on the dashboard.

KPI	Meaning and Typical Criteria
Total Bookings	Count of all records of the Hotel Booking form (11)
Average Guest Booking	Average of the Number of Guests field over all bookings (2.55)
Total Guest	Sum of the Number of Guests field over all bookings (28)
Upcoming Check-Ins	Count of bookings whose check-in is still to come (0 at the time of observation)

Table 2: KPI Cards and Their Meaning

The bookings report is organised under columns such as ID Proof Number, Number of Guests, Email Address and Contact Number, as shown in Figure 10. Together, the KPI cards, charts and report let the hotel monitor occupancy and booking status without any external analytical tool.

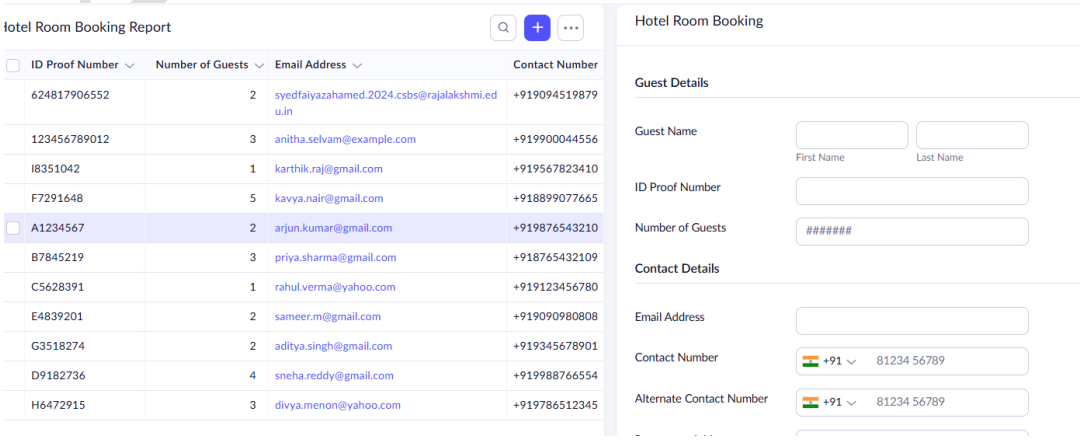

Figure 10: Hotel Room Booking Report and Booking Form

Interactive Chart Analysis

Chart	Information Shown	Interaction
Donut chart (room type)	Bookings for each room type: Standard 3, Deluxe 4, Suite 2, Executive 2	Hovering over a segment shows the room type and its exact count
Donut chart (meal plan)	Meal plan chosen: Room Only 7, Breakfast Included 13, All Meals Included 8 (total 28, equal to Total Guest)	Hovering over a segment shows the meal plan and its exact count

Table 3: Interactive Charts

The charts therefore provide the exact count behind a segment, which can be read directly instead of being estimated visually. The line chart of Total Records plots one record on each of the dates from 02-Aug-2026 to 13-Oct-2026, which matches the 11 bookings in the report.

Built-in Report Views

Option	General Description	Use in the Hotel Booking Application
List	Shows records as rows with a column for each field	Browsing all bookings
Calendar	Places records on a calendar according to a date field	Viewing check-in and check-out dates
Timeline	Arranges records chronologically	Following the booking history
Spreadsheet	Presents records in a grid similar to a spreadsheet	Reviewing many bookings together
Kanban	Displays records as cards grouped in columns, typically by status	Moving bookings from Pending to Confirmed
Import	Brings data into the form from an external file	Loading existing booking data

Table 4: Report Display Formats

Zia / AI-Assisted Feature Exploration

The application and its editor were checked for AI-assisted functionality. Possible uses of AI in a hotel booking system are listed below together with the place where each feature is checked.

AI Feature	Hotel Booking Use	Where Checked
Sentiment analysis	Judge whether a guest review is positive or negative	Form field options (Design); Deluge AI task
Keyword extraction	Pick out topics such as cleanliness or service from feedback	Form field options (Design); Deluge AI task
Prediction	Estimate the chance of a cancellation or no-show	Form field options (Design)
OCR	Read the text from an uploaded ID proof image	Form field options (Design); Deluge AI task
Zia App Builder / script help	Create parts of the application or scripts from a description	Application creation and Deluge editor

Table 5: AI Features and Where They Were Checked

24101113

The Design and Workflow areas of the editor were inspected for these options. The account displayed “Trial has expired” with an Upgrade option, and Zia / AI-assisted functionality was not available in the current account / interface. Zia was therefore not used or configured in this experiment, and no AI-generated insights were obtained. The analytics demonstrated here are the built-in dashboard and reporting features of the application.

CONCLUSION

The experiment demonstrated the built-in analytics of Zoho Creator through the Hotel Booking application. KPI cards summarise key figures, interactive charts show exact values on hovering, and the Show As menu offers several formats for viewing report data, which helps monitor bookings without external tools. The AI-assisted (Zia) capabilities, namely AI fields, AI tasks in Deluge and Zia assistance, were studied and could add insights such as guest sentiment and cancellation prediction, but they were not available in the current account / interface. The practical work
