AIM

To integrate the Hotel Booking application in Zoho Creator with Zoho CRM using a connection, a form workflow and Deluge scripting through the CRM API, so that the details of each booking are created automatically as a Lead record in Zoho CRM.

PROCEDURE

Figure 1 shows the architecture of the integration. A booking submitted through the Creator form starts a workflow, a Deluge script calls the Zoho CRM API through an authorized connection, and a Lead is created in the Leads module of Zoho CRM.

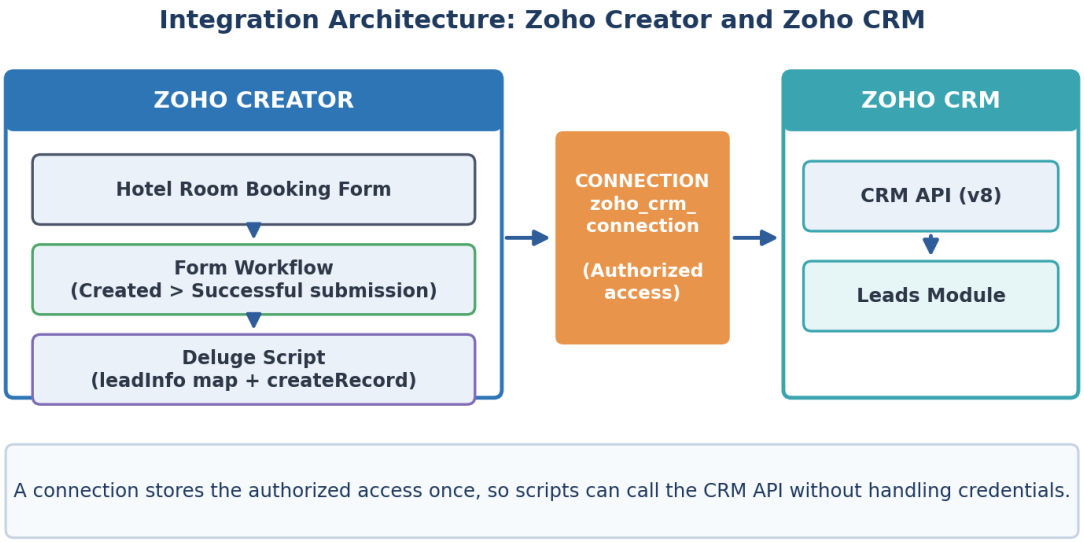

Figure 1: Integration Architecture of Zoho Creator and Zoho CRM (Conceptual Diagram)

Phase A: Create the Zoho CRM Connection

1. Sign in to Zoho Creator and open the Hotel Booking application.
2. In the left navigation panel under Develop, click Microservices.
3. Open the Connections tab. If no connection exists, the page shows a message to add one. Click Add Connection.

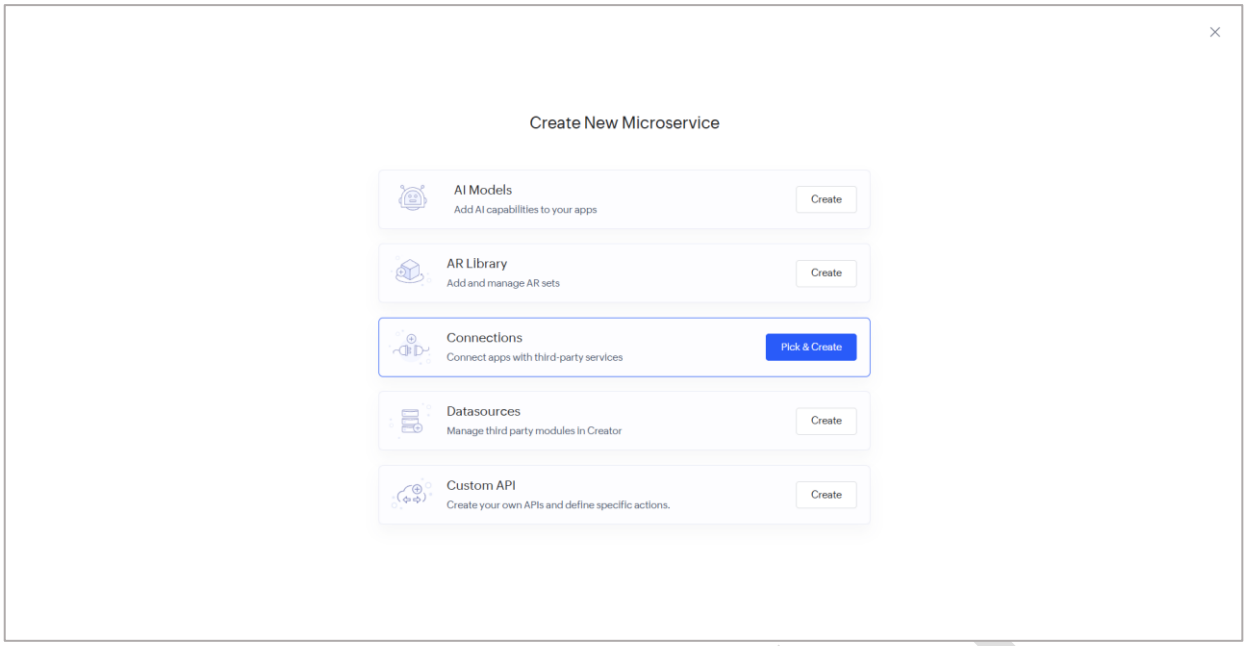

Figure 2: Microservices Page with the Connections Tab

4. From the Built-in Connector list, select Zoho CRM. In the Add Connection dialog, enter the connection details given in Table 1.
5. Click Create And Authorize and accept the authorization request.

Setting	**Value**
Connection Name	CRM Connection (link name zoho_crm_connection)
Version	Zoho CRM V1
Authorization Access	Administrators only
Connection Mode	Quick connect (Zoho credential)
Access	All Actions

Table 1: Connection Settings

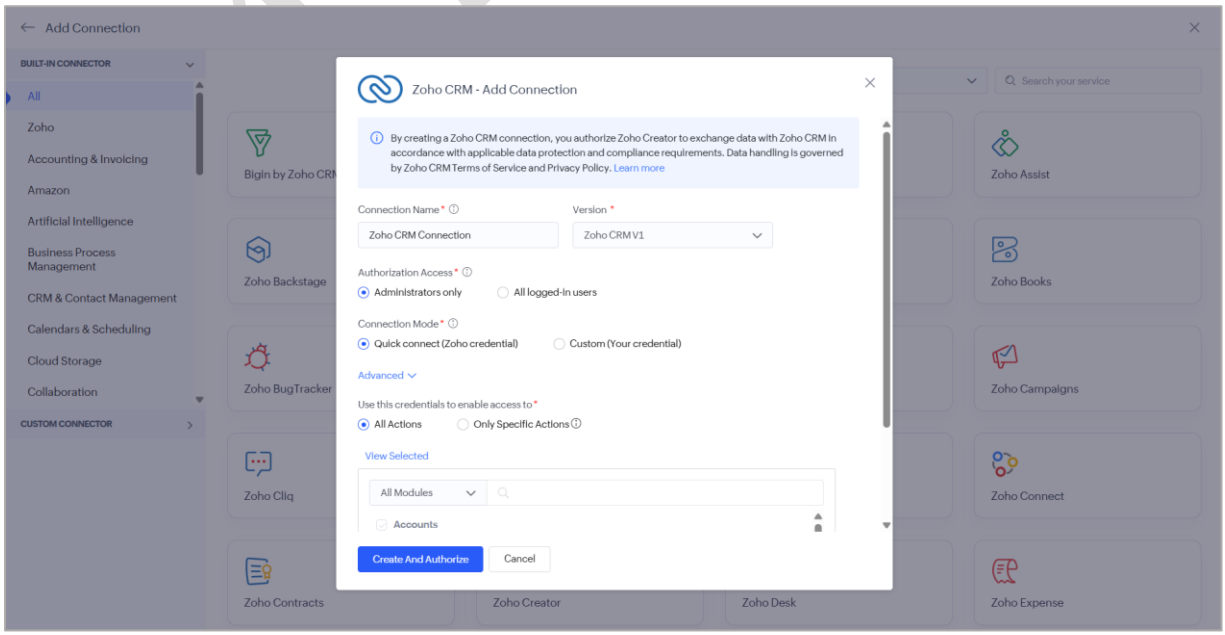

Figure 3: Zoho CRM – Add Connection Dialog

Phase B: Verify the Connection

1. Return to Microservices > Connections and check that the Zoho CRM Connection card appears with the link name zoho_crm_connection and a Connected status.
2. Open the connection and confirm that the Hotel Booking application is switched On under Connection Access.

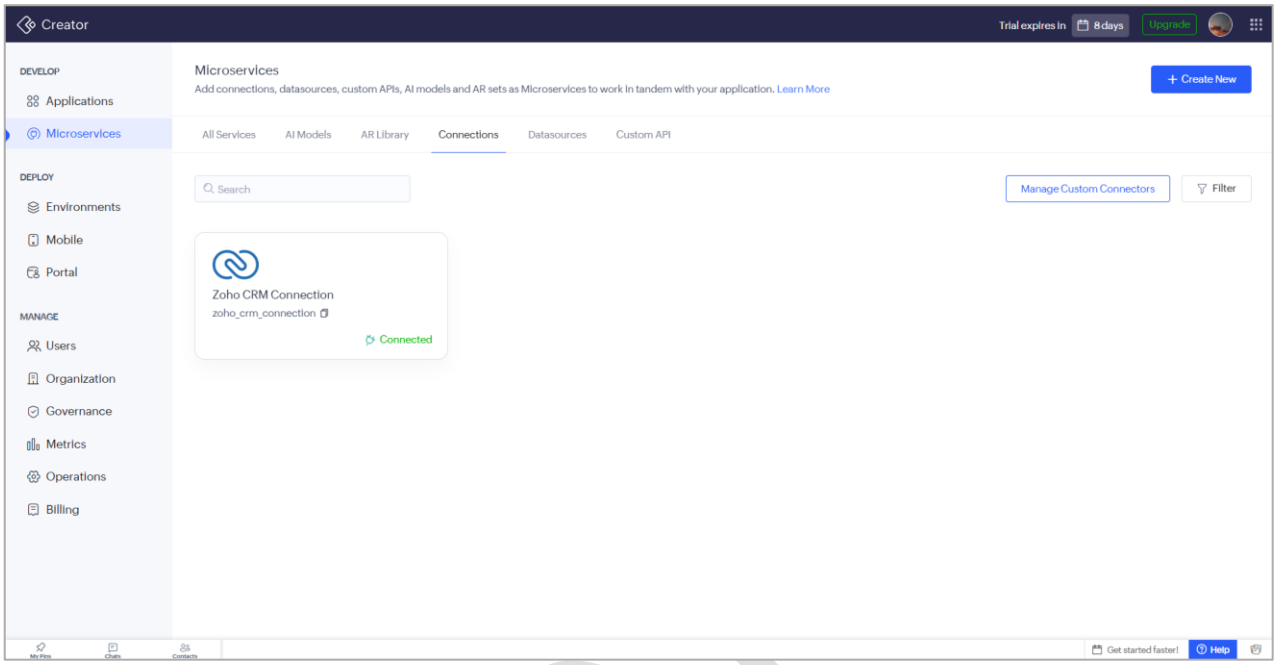

Figure 4: Zoho CRM Connection Showing the Connected Status

Phase C: Set Up the Form Workflow

1. Open the Hotel Room Booking form and select the Workflow tab.
2. Create a new form workflow that runs on Created > Successful form submission, and name it “Send booking to CRM”.
3. In the Add New Action panel, set Run this action to Always and choose Deluge script.

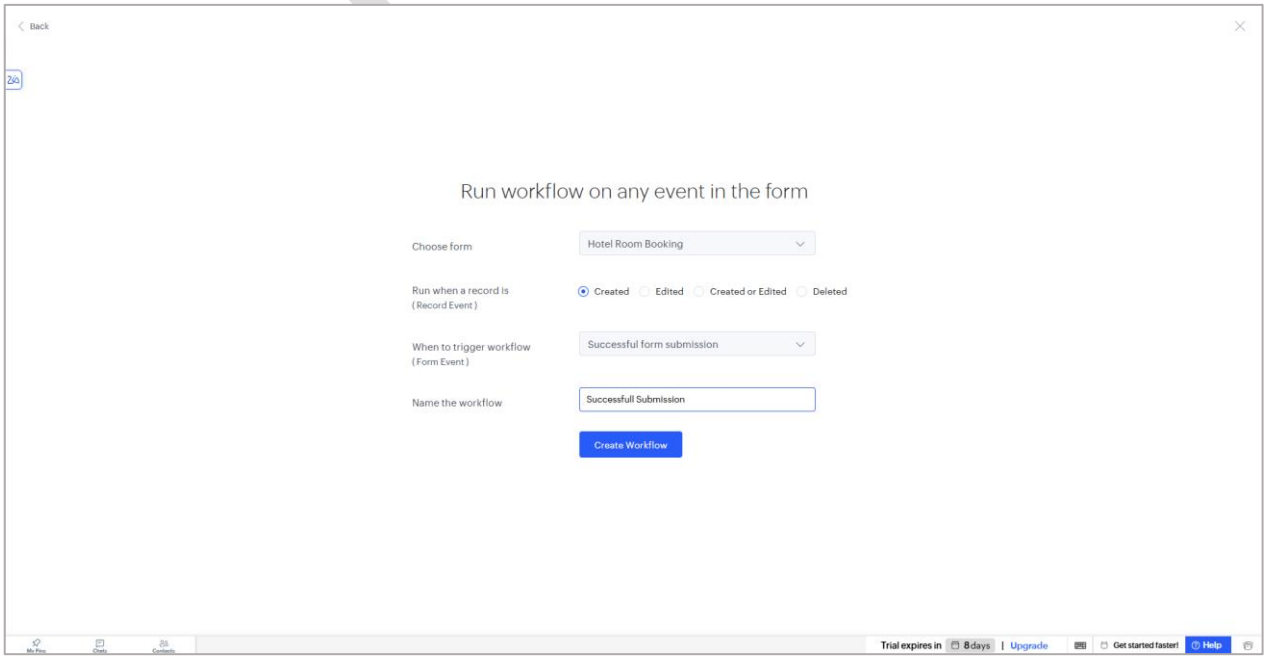

Figure 5: Form Workflow for the Hotel Room Booking Form

Phase D: Write the Deluge Script

1. In the Deluge editor, create a map named leadInfo and map the form fields to the CRM Lead fields as shown in Figure 6.
2. Call zoho.crm.v8.createRecord with the Leads module, the map and the connection link name, and store the result in response.
3. Use info statements to trace the start of the action and the response returned by Zoho CRM.
4. Click Save to validate and save the script.

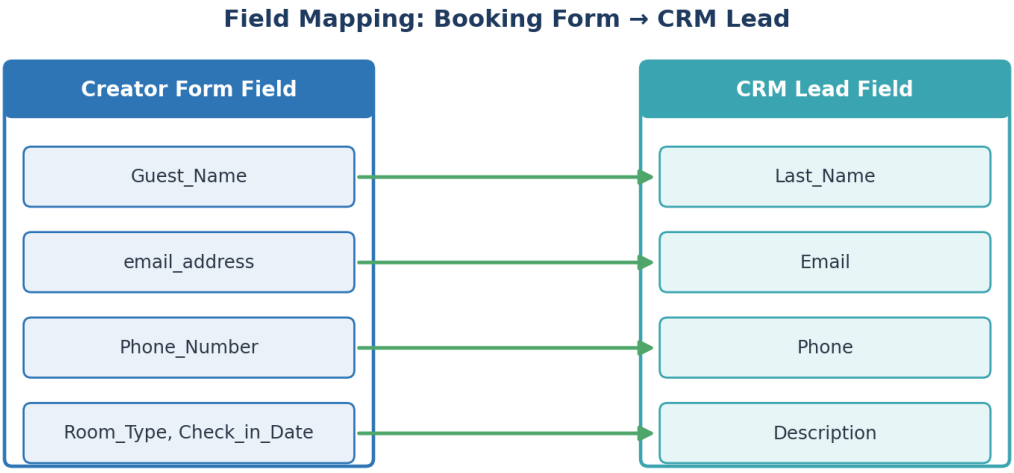

Figure 6: Mapping of Creator Form Fields to CRM Lead Fields

```
// prepare lead data
leadMap = Map();
leadMap.put("Last_Name", input.Guest_Name.first_name + " " +
input.Guest_Name.last_name);
leadMap.put("Email", input.email_address);
leadMap.put("Phone", input.contact_number);

// summary description
summary = "room: " + input.Room_Type + " | guests: " +
input.number_of_guests.toString() + " | check-in: " +
input.Check_In_Date.toString() + " " + input.Preferred_Check_In_Time.toString();
leadMap.put("Description", summary);

// push to zoho crm
response = zoho.crm.v8.createRecord("Leads", leadMap, Map(),
"zoho_crm_connection");

// send confirmation email
sendmail
[
       from: zoho.adminuserid
       to: input.email_address
       subject: "booking confirmation"
       message: "Dear " + input.Guest_Name.first_name + ",\n\nYour room booking for
" + input.Check_In_Date.toString() + " is confirmed."
];
```

The script builds the leadInfo map, creates the Lead through the connection and displays the response. Figure 7 shows the sequence of the call.

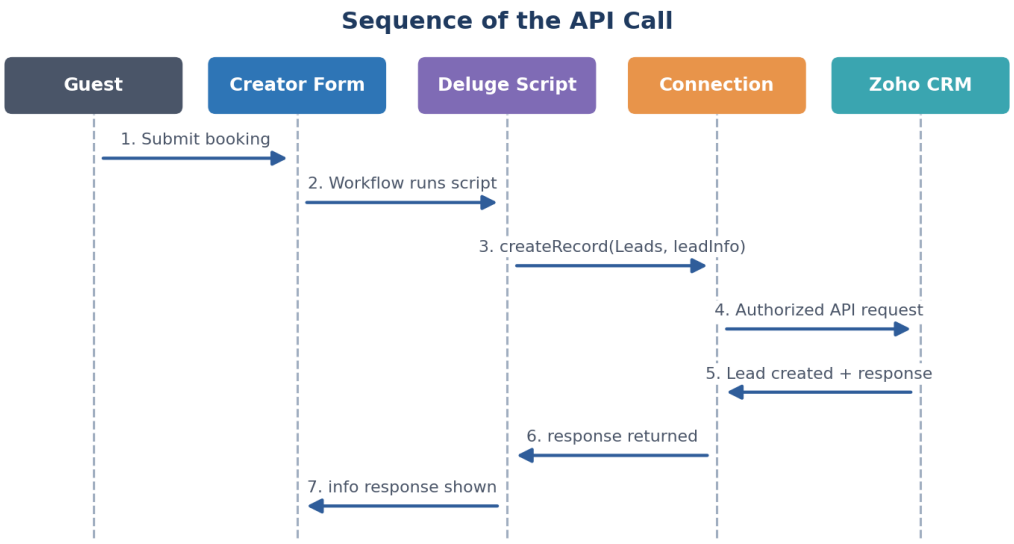

Figure 7: Sequence of the API Call (Conceptual Diagram)

Figure 8: Deluge Script Editor for the CRM Integration

Phase E: Test the Integration

1. Open the live Hotel Booking application and fill in the booking form with test data.
2. Click Submit and check the response displayed by the info statements.
3. Open Zoho CRM, go to the Leads module and check that a new Lead has been created with the booking details.

If the Lead is not created, check that the connection is Connected, that the link name in the script is correct, that the Lead field names are spelled correctly and that the required field Last_Name has a value.

OUTPUT

The integration was set up through a connection, a form workflow and a Deluge script.

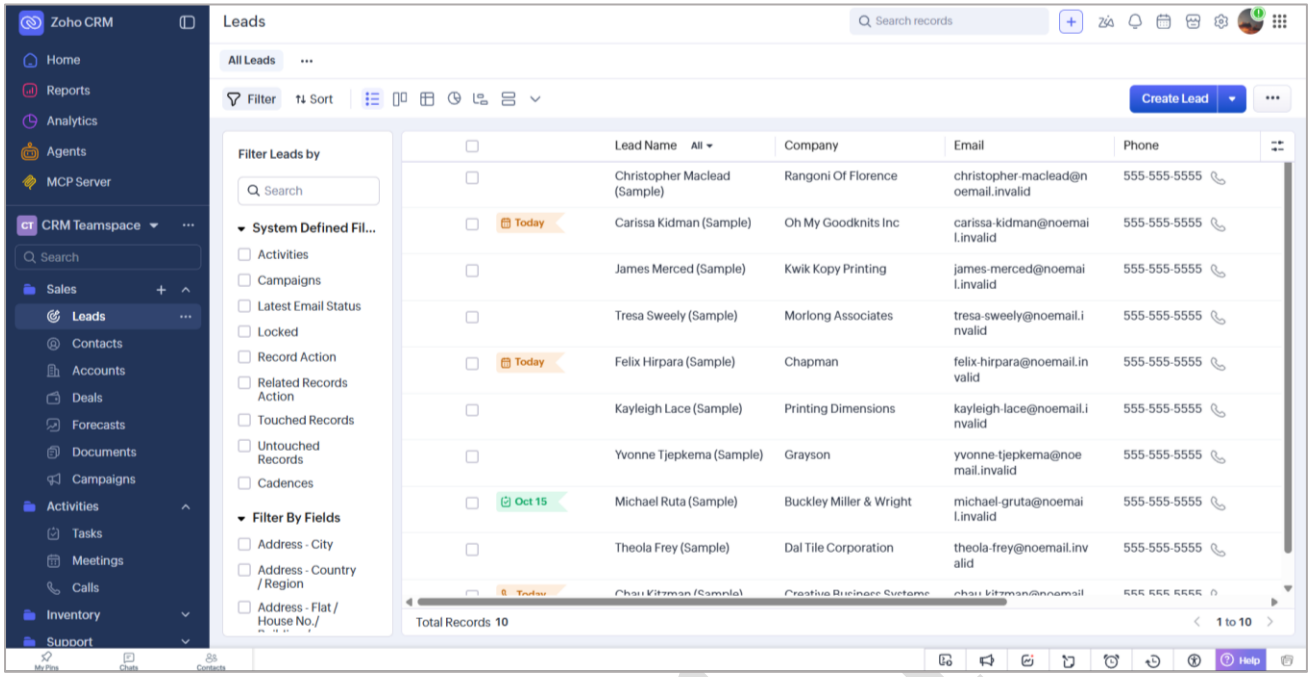

Figure 9: Hotel Booking Form Filled with Test Data

- **Connection status:** the Zoho CRM Connection shows Connected.
- **Script reference:** the link name zoho_crm_connection is used in the form workflow script.
- **Target module:** the record created by the workflow is added to the Leads module of Zoho CRM with the booking details.

RESULT

The Hotel Booking application in Zoho Creator was integrated with Zoho CRM using a connection, a form workflow and Deluge scripting. On every successful booking submission, the details were pushed automatically to Zoho CRM as a Lead, which demonstrates how a low-code application can work with another Zoho service through connections and APIs.
